August 2026

Executive summary

Situation:

The restaurant generated stable sales throughout the year, but revenue is concentrated in a small number of products, sizes, and peak operating periods.

Complication:

Large pizzas and a limited set of menu items drive a disproportionate share of revenue. Any stockout, slow service, or staffing shortage during peak hours directly impacts the restaurant's highest-value sales.

Question:

How can the restaurant increase revenue and reduce operational risk without expanding the menu or increasing fixed costs?

Recommendation:

Focus inventory, staffing, and operational planning on **large pizzas during lunch (12 -1 PM) and dinner (5-7 PM) peaks**, with particular emphasis on **Fridays and the top-performing pizza portfolio**.

Expected impact: Protect the restaurant's primary revenue engine, reduce stockout risk during peak periods, improve service speed, and increase revenue from existing customer demand.

Supporting analyses

1. Revenue is concentrated in large pizzas

Large pizzas are the restaurant's strongest revenue driver.

<i>Pizza size</i>	<i>Revenue contribution</i>
Large	45.89%
Medium	30.49%
Small	21.77%
XL	1.72%
XXL	0.12%

Large pizzas also account for **38.24% of total units sold**, making them both the highest-volume and highest-revenue segment.

Business implication:

The restaurant should prioritize ingredient availability, preparation capacity, and service speed for large pizzas because they generate nearly half of total revenue.

2. Revenue is driven by a small set of category-size combinations

The highest-performing combinations are concentrated in **large pizzas across multiple categories**.

<i>Category-size combination</i>	<i>Revenue contribution</i>
Veggie - Large	12.74%
Chicken - Large	12.51%
Supreme - Large	11.53%
Classic - Large	9.11%

Together, these four combinations contribute **45.89% of total revenue**.

Business implication:

The restaurant should treat these combinations as **priority products** for inventory planning, promotions, and operational execution.

3. Peak hours and top products create operational concentration risk

Peak revenue hours:

<i>Hour (12-hour clock)</i>	<i>Orders</i>	<i>Revenue (\$)</i>
12 pm	2,520	111,877.90
1 pm	2,455	106,065.70
6 pm	2,399	89,296.85
5 pm	2,336	86,237.45
7 pm	2009	72,628.90

The restaurant experiences two clear demand peaks: **lunch (12-1 PM)** and **dinner (5-7 PM)**.

Day-of-week performance:

<i>Day</i>	<i>Orders</i>	<i>Revenue (\$)</i>
Friday	3,538	136,073.90
Thursday	3,239	123,528.50
Saturday	3,158	123,182.40
Sunday	2,624	99,203.50

Fridays generate the highest revenue and order volume and while Sunday generates the lowest.

Top revenue-generating pizzas:

<i>Pizza</i>	<i>Revenue (\$)</i>
The Thai Chicken Pizza	43,434.25
The Barbecue Chicken Pizza	42,768.00
The California Chicken Pizza	41,409.50

The top-performing pizzas contribute a significant share of total revenue, creating meaningful stockout and execution risk.

Business implication:

Peak staffing and inventory should be concentrated around **12-1 PM and 5-7 PM**, with additional operational capacity on **Fridays**. The top-selling pizzas require higher inventory buffers and faster production workflows.

Final recommendation

The restaurant should implement a **peak-period revenue protection strategy** centered on its highest-value products.

Priority actions

1. Increase inventory buffers for **large pizza ingredients**.
2. Schedule additional kitchen and service staff during **12-1 PM and 5-7 PM**.
3. Prioritize production capacity for the **top 10 revenue-generating pizzas**.
4. Prepare Friday-specific staffing and inventory plans.
5. Monitor stockouts and preparation time for large pizzas as core operational KPIs.
6. Review the commercial viability of **XL and XXL sizes**. Together they contribute **only 1.84% of revenue**, so evaluate whether they should be redesigned, bundled, repriced, or potentially discontinue the XL and XXL sizes since they add very little revenue while **increasing menu complexity, eventually leading to unnecessary operational and inventory costs**.

This strategy targets the restaurant's most valuable customers, products, and time periods, maximizing revenue with minimal operational complexity.

Analyst note

*The analysis indicates that revenue growth is more likely to come from **optimizing the existing high-performing segments** than from expanding the menu. Large pizzas, peak-hour execution, and top-product availability represent the restaurant's highest-leverage improvement opportunities.*
